Objective:

- Set up CloudWatch to monitor metrics and logs.
- Create alarms for proactive monitoring.

Prerequisites:

- An active EC2 instance.

Steps:

1. Enable Monitoring for EC2:

- Navigate to the **Monitoring** tab in the EC2 dashboard.
- Verify metrics like CPU utilization and network activity.

2. Create a CloudWatch Alarm:

- Go to **CloudWatch > Alarms > Create Alarm**.
- Select a metric (e.g., EC2 CPU Utilization).
- Define thresholds (e.g., CPU > 70%) and set notification actions.

3. Analyze Logs:

- Install the CloudWatch Agent on the EC2 instance:
- `sudo yum install amazon-cloudwatch-agent`
- `sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agent-config-wizard`
- `sudo systemctl start amazon-cloudwatch-agent`
- View logs in the **CloudWatch Logs** section.

4. Create a CloudWatch Dashboard:

- Go to **Dashboards > Create Dashboard**.
- Add widgets for metrics like CPU, memory, and disk usage.
